

# DIPTYQUE FORMULATION CHARTER

Diptyque attaches the utmost importance to the formulation of its products. We aim to offer an exceptional sensorial experience – one that fully meets our own aspirations in terms of health and respect for the environment. We have therefore chosen to go beyond the regulations currently in force and draw up our own formulation charter.

Under this, each range of perfumes and cosmetics, candles, home fragrances and household products – devised and produced mainly in France – is guided by its own particular set of specifications defining and delineating our composition requirements. Those specifications have been rigorously applied to all new creations since 2023. In an ongoing process of constant improvement, the existing portfolio, which already complies with current regulations, will also be reformulated step by step to bring it into line with our new requirements.

## THE BEST OF THE NATURAL, THE BEST OF THE SYNTHETIC

First and foremost, our products are formulated with the very finest ingredients. Whether natural or synthetic, these are selected for their quality, high performance and safety. Naturally occurring raw materials – for which we systematically demand on guarantees of traceability and responsible sourcing – are not always a satisfactory solution, either in terms of effective performance and safety or from a social and environmental viewpoint, which is why we complement them with synthetic materials. Along with our partners and perfumers, we're always looking for more ingredients produced using ethical methods, such as green chemistry or biotechnology.

## EXCLUDED OR RESTRICTED INGREDIENTS

The moment there is the slightest concern that an ingredient may be unsafe or toxic to the environment or raise any ethical issues, we exclude it. Certain entire families of ingredients have been excluded from our new products since 2023, such as ingredients of animal origin or those obtained from endangered plant species. Also excluded are nanoparticles, silicones, microplastics and any colourants that are not essential to our formulations. Should UV filters, antioxidants, preservatives or solvents be considered necessary to ensure the quality of a product, they are used in moderation or selected from a restricted list. We also use biodegradable molecules wherever possible, especially in our rinse-off products, so as to limit the environmental impact of our formulations.

## PERFUME: AT THE HEART OF ALL OUR CREATIONS

Our perfume concentrates, which are present in all our ranges, comply with the standards set by IFRA, the International Fragrance Association, thereby ensuring the highest level of safety. We also impose supplementary requirements on our partners, especially when it comes to our home fragrances, in respect of which the existing legislation is less restrictive. As such, we automatically exclude certain perfume molecules on health, environmental or ethical grounds. Moreover, we also insist that our perfumers guarantee responsible sourcing and a responsible supply chain for all natural raw materials used in our perfumes.

## CHOOSING MINERAL WAX

We never compromise on olfactory performance or burning quality, and that's why our candles are composed primarily of mineral waxes. Each Diptyque candle is the product of a unique blending of multiple high-quality waxes, the precise blend being determined by the candle's fragrance and size. These mineral waxes, which are the same as those used in cosmetics, all comply with European legislation, the most restrictive in the world. They optimise the diffusion of the perfume notes while also guaranteeing the finest possible burning experience and respecting all applicable safety standards.
